Collection of closely spaced seismic data over an area permits three-dimensional processing of the data as a volume. The volume concept is equally important to the

seismic interpreter. With 3-D data, the interpreter is working directly with a volume rather than interpolating a volumetric interpretation from a widely-spaced grid of observations.

In 1977 and 1978, a seismic survey was shot over the Dunlin field and processed using the technique of three-dimensional (3D) migration. Earlier seismic control together with appraisal drilling had proved

that development of the field would be commercially viable, but the reservoir configuration was poorly defined. The 3D survey achieved its objectives of increasing confidence in the structural interpretation and providing a firmer basis for field development planning. planning.

Several volume seismic attributes were

used to interpret the field: reflection strength, cosine of instantaneous phase, variance and chaos, which made seismic interpretation much easier. Moreover, the ant tracking attribute workflow has been elaborated which greatly facilitated the monitoring and interpretation of the fault systems.
