Introduction Nuclear magnetic resonance or NMR is one of the most widely used discoveries of Modern Physics. NMR is based on the bulk magnetic properties of materials made up of certain isotopes, most notably, protons ( $^1\text{H}$ ), but encompassing a wide variety of species including  $^{13}\text{C}$ ,  $^{19}\text{F}$ , and  $^{29}\text{Si}$ .

Introduction Basic concepts. The resonance frequency of a nuclear spin depends on the strength of the magnetic field at the nucleus, which can be modified by the electron cloud or the proximity of another spin. In general, these local fields are orientation dependent. In media with no or little mobility (e.g. crystalline powders, glasses, large membrane vesicles, molecular aggregates ...

Spectroscopy NMR spectroscopy identifies the carbon – hydrogen framework of an organic compound. Certain nuclei, such as  $^1\text{H}$ ,  $^{13}\text{C}$ ,  $^{15}\text{N}$ ,  $^{19}\text{F}$ , and  $^{31}\text{P}$ , have a nonzero value for their spin quantum number; this property allows them to be studied by NMR. 2 Nuclear Magnetic Resonance Spectroscopy

This chapter discusses nuclear magnetic  
resonance (NMR). NMR is the branch of  
spectroscopy operating in the  
radiofrequency region of an electromagnetic  
spectrum. It arises from the interaction  
between atomic nuclei and a magnetic field.  
Compared with other areas of physics,  
NMR signals are relatively weak and must be  
sought and managed with care.

Nuclear magnetic resonance (NMR) spectroscopy is a technique that takes advantage of the quantum mechanical properties of the atomic nucleus known as spin. Nuclei with spin quantum numbers different to zero behave with a finite charge distribution, thus having a magnetic moment proportional and parallel to the nuclear spin.
