A criticism of the book "a la recherche du temps perdu"

From the author of the acclaimed *Queen of Fashion*--a brilliant look at the glittering world of turn-of-the-century Paris through the first in-depth study of the three women Proust used to create his supreme fictional character, the Duchesse de Guermantes. Geneviève Halévy Bizet Straus; Laure de Sade, Comtesse de Adhéaume de Chevigné; and Élisabeth de Riquet de Caraman-Chimay, the Comtesse Greffulhe--these were the three superstars of fin-de-siècle Parisian high society who, as Caroline Weber says, "transformed themselves, and were transformed by those around them, into living legends:

paragons of elegance, nobility, and style." All well but unhappily married, these women sought freedom and fulfillment by reinventing themselves, between the 1870s and 1890s, as icons. At their fabled salons, they inspired the creativity of several generations of writers, visual artists, composers, designers, and journalists. Against a rich historical backdrop, Weber takes the reader into these women's daily lives of masked balls, hunts, dinners, court visits, nights at the opera or theater. But we see as well the loneliness, rigid social rules, and loveless, arranged marriages that constricted these women's lives. Proust, as a twenty-year-old law student in 1892, would worship them from afar, and later meet them and create his celebrated composite character for *The Remembrance of Things Past*.

The world's fresh water supplies are

dwindling rapidly—even wastewater is now considered an asset. By 2025, most of the world's population will be facing serious water stresses and shortages.

*Aquananotechnology: Global Prospects* breaks new ground with its informative and innovative introduction of the application of nanotechnology to the remediation of contaminated water for drinking and industrial use. It provides a comprehensive overview, from a global perspective, of the latest research and developments in the use of nanotechnology for water purification and desalination methods. The book also covers approaches to remediation such as high surface area nanoscale media for adsorption of toxic species, UV treatment of pathogens, and regeneration of saturated media with applications in municipal water supplies, produced water from fracking, ballast water, and more. It

also discusses membranes, desalination, sensing, engineered polymers, magnetic nanomaterials, electrospun nanofibers, photocatalysis, endocrine disruptors, and Al<sub>13</sub> clusters. It explores physics-based phenomena such as subcritical water and cavitation-induced sonoluminescence, and fog harvesting. With contributions from experts in developed and developing countries, including those with severe contamination, such as China, India, and Pakistan, the book's content spans a wide range of the subject areas that fall under the aquanotechnology banner, either squarely or tangentially. The book strongly emphasizes sorption media, with broad application to a myriad of contaminants—both geogenic and anthropogenic—keeping in mind that it is not enough for water to be potable, it must also be palatable.

Proust's involvement with fin-de-siècle 'hysteria', and its impact on the writing of his great novel.

Understanding and being able to predict fluvial processes is one of the biggest challenges for hydraulics and environmental engineers, hydrologists and other scientists interested in preserving and restoring the diverse functions of rivers. The interactions among flow, turbulence, vegetation, macroinvertebrates and other organisms, as well as the transport and retention of particulate matter, have important consequences on the ecological health of rivers. Managing rivers in an ecologically friendly way is a major component of sustainable engineering design, maintenance and restoration of ecological habitats. To address these challenges, a major focus of River Flow 2016 was to highlight the

latest advances in experimental, computational and theoretical approaches that can be used to deepen our understanding and capacity to predict flow and the associated fluid-driven ecological processes, anthropogenic influences, sediment transport and morphodynamic processes. River Flow 2016 was organized under the auspices of the Committee for Fluvial Hydraulics of the International Association for Hydro-Environment Engineering and Research (IAHR). Since its first edition in 2002, the River Flow conference series has become the main international event focusing on river hydrodynamics, sediment transport, river engineering and restoration. Some of the highlights of the 8th International Conference on Fluvial Hydraulics were to focus on inter-disciplinary research involving, among others, ecological and biological aspects relevant to river flows

and processes and to emphasize broader themes dealing with river sustainability. River Flow 2016 contains the contributions presented during the regular sessions covering the main conference themes and the special sessions focusing on specific hot topics of river flow research, and will be of interest to academics interested in hydraulics, hydrology and environmental engineering.

This collection of interdisciplinary essays explores the range of French and francophone encounters with the East from the medieval period to the present day. --book cover.

Proust, Pastiche, and the Postmodern, or Why Style Matters argues against the traditional view that Marcel Proust wrote pastiches, that is, texts that imitate the style of another author, to master his

literary predecessors while sharpening his writerly quill. On the contrary, James F. Austin demonstrates that Proust's oeuvre, and *In Search of Lost Time* in particular, deploy pastiche to other ends: Proust's pastiches, in fact, "do things with words" to create powerful real-world effects. His works are indeed performative acts that forge social relationships, redefine our ideas of literature, and even work against oppressive political and economic discourses. Building on the "speech-act" theory of J.L. Austin, Jacques Derrida, and J. Hillis Miller, and on the postmodern theory of Fredric Jameson, this book not only elucidates the performative nature of pastiche, but also shows that the famous "Goncourt" pastiche from *In Search of Lost Time* has attracted so much attention because it already attained the postmodern; that is, it eliminated temporal depth and experience, transforming time

itself into a nostalgic style of an era, and into the sort of aestheticized surface that came to define postmodernism decades later. To reflect this transformation of pastiche, this work rearticulates its history in France around Proust. Reconfiguring a scholastic, classically-inspired pedagogical tradition based on imitation, and breaking with the dominant satirical practice, Proust's work opened up possibilities in the twentieth century for a new kind of pastiche: playful and performative in the literary field, and postmodern in a French cinema that, as with the Goncourt pastiche, represents time as the visual style of an era, whether unreflexively in "heritage" films such as Régis Wargnier's *Indochine*, or discerningly in Eric Rohmer's *Lady and the Duke*, which uses period pictorial and painterly conventions to illustrate how the representation of history onscreen

This book includes a collection of extended papers based on presentations given during the SIMHYDRO 2021 conference, held in Sophia Antipolis in June 2021 with the support of French Hydrotechnic Society (SHF). It focused on "Models for complex and global water issues—Practices and expectations". The water field is continuously mobilizing models for addressing complex issues and new challenges. Within the context of the climate change, the water issues are exacerbated with the competition among uses. The limited water resources request from the modern societies to review some of the historical paradigms traditionally used and to promote new approaches for a sustainable management. The combined complexity and vulnerability of large urban environments request a deep

understanding of water uses and environmental synergy. At the same time, water-related natural hazards are contentiously straightening modern societies that must adapt and implement a more resilient environment. In parallel, in the industrial sector, the search for a high level of efficiency for hydraulic machinery requests to simulate complex processes. Under all these situations, the models currently used represent only partly the physical phenomena involved, the scale of the processes, the hypothesis included within the different numerical tools, etc. The design and the operation of relevant models represent a challenging task for the modeller who is responsible of the knowledge part of a global system that is dedicated to support the decision makers.
