**Astrophotography**

**Guide**

Start with an aperture as wide open as the lens goes (perhaps  $f/4.5$  for a zoom lens or  $f/2.8$  for a wide-angle lens). ISO 100 is used for bright conditions, so consider ISO 800 for

Download File

PDF Sky At

astrophotography for more sensitivity, though ISO 1600 or 3200 may work better depending on how advanced your camera is.

What is Astrophot

Astrophotography?

Astrophotography is just

another subgenre of

photography. While you

have probably heard of

the more traditional

photography genres like

nature, landscape, street,

portrait, macro, and

many others,

astrophotography is all

about capturing images

of the night sky.

## Night Sky & Star Photography Guide

First things first, you need a powerful lens for astrophotography. The night sky is very dark so you need a lens with a fast aperture to capture the most amount of light from the stars. Aperture is measured in F-stop, which is formatted as an f/number. The lower the number, the faster the

**night sky ...**

In night sky photography, except for star trails, you want to have stars like points of light. But stars move across the horizon at, on average, about  $15^\circ$  / hour because of Earth's rotation. That does not seem much when we stargaze. But consider that a 100mm lens on a full-frame camera gives
