TCP directs the Linux operating system on how packets should move from one place to another. It also controls network traffic and directs the transmission of packets of information (like folders of data moving from one

place to another).

This is why the  
protocol is called  
Transmission Control  
Protocol (TCP).  
Internet Protocol (IP)

Networking is so  
deeply embedded in  
Linux that its Unix  
domain sockets (also  
called inter-process

If you feel like sniffing TCP/IP packets, you can use tcpdump, a command-line utility that comes with Linux. As its name implies, it dumps (prints) the headers of TCP/IP network packets. To use tcpdump, log in as root and type the tcpdump command

ip in a terminal window. Typically, you want to save the output in a file and examine that file later.
